. . I've tried using the -J (Java) command line switch, but it gives me the same error. A: The error you get is actually not due to a wrong command line parameter, it is an error from the Ant build script, which failed to load the JDK 1.6 JAR. The error you get is not coming from Ant, but from your JDK1.6 JAR file. From the log output you posted, it looks like the JDK1.6 JAR file you are using is not in the classpath, because you are using Ant's JDK1.5 JAR. You can either update the JAR file to the JDK 1.6 JAR file you have, or you can use the -Xbootclasspath/p option to pass the JDK 1.6 JAR file into the Ant command line. 1.

Field of the Invention The present invention relates to a link apparatus, and more particularly, to a link apparatus having a mechanism that allows for positioning between a plurality of links and sliding movement of the links on the bottom thereof. 2. Description of the Related Art In the conventional art, a link apparatus typically includes two link structures disposed at a base

frame and a counter frame for movement between a locked state and an unlocked state. Each link structure includes at least one link. The link can move in the direction of the other link or the counter link in the locked state of the link structure. Further, the link structure can be moved in the direction of the other link or the counter link in the unlocked state. In the conventional art, the locking state of the link structure is controlled by a locking element. The locking element is designed to engage the corresponding link and form a locking state. However, when the locking element is activated, it must be driven to engage the corresponding link and form the locking state. The locking element will be worn after a period of use. The 82157476af
